# Resource Deployment

IR3 features a Resource Deployment module which enables Controllers, Supervisors and Managers real time analysis of what resources (vehicles and people) are available, their current operational status and location.

The module can also provide historic analysis of incidents, operations and patrols enabling managers to review the effectiveness of how resources were managed.

## Features

IR3 includes core features which assist resource deployment and management, including:

- Connection with Airwave radio GPS data to provide near real-time analysis of the location of vehicles and personnel, which assists in deploying resources to incidents by showing the nearest available resource
- Displays how resources were deployed and provides analysis on how demand has been met by the resources
- Geofences showing demand, incidents, and also how resources have been deployed
- Analysis of time spent to allocate resources, resources committed, and time spent dealing with incidents

## Benefits

- ✓ Helps controllers to optimise their resources by easily identifying which resources can be deployed without the need to make requests for resources via the radio or mobile terminal
- ✓ Ensures the right resources in terms of skills and equipment are deployed, will enable the incident to be dealt with effectively
- ✓ Retrospectively analyses how resources have been deployed will assist managers in setting patrol strategies and response expectations
- ✓ Assist managers in analysing how effective revised patrol strategies and response plans have been and provide additional feedback so aiding future plans and strategies
- ✓ Overlays several types of data such as incidents, with vehicle and personnel data gives the manager a good overview of how well incidents are dealt with and where improvements could be made
